# **Java Arraylist**

Sometimes it's better to use dynamic size arrays. Java's Arraylist can provide you this feature. Try to solve this problem using Arraylist.

You are given n lines. In each line there are zero or more integers. You need to answer a few queries where you need to tell the number located in  $y^{th}$  position of  $x^{th}$  line.

Take your input from System.in.

# **Input Format**

The first line has an integer n. In each of the next n lines there will be an integer d denoting number of integers on that line and then there will be d space-separated integers. In the next line there will be an integer q denoting number of gueries. Each guery will consist of two integers x and y.

### **Constraints**

- 1 <= n <= 20000
- 0 <= d <= 50000
- 1 <= *q* <= 1000
- 1 <= x <= n

Each number will fit in signed integer.

Total number of integers in n lines will not cross  $10^5$ .

## **Output Format**

In each line, output the number located in  $y^{th}$  position of  $x^{th}$  line. If there is no such position, just print "ERROR!"

# **Sample Input**

```
5
5 41 77 74 22 44
1 12
4 37 34 36 52
0
3 20 22 33
5
1 3
3 4
3 1
4 3
5 5
```

## **Sample Output**

```
74
52
37
ERROR!
ERROR!
```

### **Explanation**

The diagram below explains the queries:
